## An Empirical View on Consolidation of the Web TOIT '22

Trinh Viet Doan, Roland van Rijswijk-deij,  
Oliver Hohlfeld, Vaibhav Bajpai

### Motivation and Problem Statement

- ▶ The Web was initially (30 years ago) designed to be a decentralised system.
- ▶ Lately, there are concerns of Web traffic increasingly getting brokered via hyper-giants.
- ▶ Such Web **consolidation** raises technical, societal (privacy) and economical (innovation) concerns.
- ▶ However, contemporary empirical studies on Web consolidation are **still lacking**.

To what extent does web content centralise at hyper-giants (Google *et al.*) for content delivery and hosting?

How lop-sided is the deployment of new innovations on the Internet (protocols) due to such large hyper-giants?

## ▶ Landing webpages

- ▶ Consolidation (>160M websites) has increased by **>80%** from 8% (2015) to 15% (2020)
- ▶ >24% of popular websites (top 1M) host their landing page on a hyper-giant.

## ▶ Web content

- ▶ **>56%** of popular content (top 4.3M webpages) is hosted on a hyper-giant.
- ▶ A landing page hosted on a hyper-giant, also has **>80%** of its content hosted on one of them.
- ▶ Google and Amazon contribute to **>52%** of content hosted on hyper-giants.

A first study to provide a longitudinal empirical grounding of Web consolidation.

# Consolidation of the Web | Landing webpages

- ▶ .com | .net | .org (>160M domains) – 50% of global DNS namespace
- ▶ Hyper-giant penetration – 8.2% (2015) → 15% (2020), an increase by >83%
- ▶ [Amazon](#) accounts to >50% of hyper-giant growth alone in .com.

Hyper-giant penetration has nearly **doubled** from 2015–2020, and is **higher** among more popular domains.

## Evaluating Public DNS Services in the Wake of Increasing Centralization of DNS

NETWORKING'21

Trinh Viet Doan, Justus Fries, Vaibhav Bajpai

### Motivation and Problem Statement

- ▶ Many new public DNS services have lately emerged.
- ▶ They promise reliability, lower latency and security.
- ▶ Previous studies (>5 years old) showed ISP resolvers are commonly used and provide better performance.
- ▶ However, there exists a **large gap** in the evaluation of new public DNS services.

Launch		IPv4 Address	IPv6 Address
2020-05	NextDNS	45.90.28.0	2a07:a8c0::
2018-04	Cloudflare DNS	1.1.1.1	2606:4700:4700::1111
2017-11	Quad9	9.9.9.9	2620:fe::9
2017-02	CleanBrowsing	185.228.168.168	2a0d:2a00:1::1
2017-02	Neustar UltraRecursive	156.154.70.1	2610:a1:1018::1
2015-09	VeriSign Public DNS	64.6.64.6	2620:74:1b::1:1
2013-11	Yandex DNS	77.88.8.8	2a02:6b8::feed:ff
2009-12	Google Public DNS	8.8.8.8	2001:4860:4860::8888
2006-07	OpenDNS	208.67.222.123	2620:0:ccc::2
2000-06	OpenNIC	185.121.177.177	2a05:dfc7:5::5353

What is the popularity, closeness (path lengths), and latency of these new public DNS services?

In which scenarios would switching to these public DNS services offer benefit?

### Recap

### References

## ► Popularity

>28% of all probes use  $\geq 1$  public DNS service.

Google public DNS used by >75% of these probes.

## ► Closeness

Google Public DNS is one AS hop away from the ISP.

Cloudflare/Quad9 Public DNS have a transit AS in between.

## ► Response Times

Public DNS service is slower than ISP resolvers in regions beyond EU and NA.

Latencies over IPv6 to public DNS services are inflated in SA and AF.

## Methodology

- \* 2.5K RIPE Atlas home probes (>1K IPv6 capable)
- \* covering 720 ASes in > 85 countries.
- \* 10 public resolvers + ISP local resolvers.
- \* 30K ICMP traceroutes to DNS + ISP local resolvers.
- \* 12M DNS over UDP/53 requests/responses.

# DNS Centralisation | Popularity

- ▶ >7.5k probes use local ISP resolvers. (>71%)
- ▶ **3k** probes use at least one public DNS service.  
1.4k probes use **only** public DNS services.  
1.6k probes use a mix of local ISP + public DNS service.  
Google is the most popular DNS service.
- ▶ 1k probes use **one and only one** public DNS service.

	# Probes	# Probes with <i>n</i> Publ. Services	# Employing Probes
Public only	1,371 (12.9%)	978, <i>n</i> = 1 (71.3%)	Google: 1,001 (55.5%) Cloudflare: 527 (29.2%) Quad9: 126 (7.0%) OpenDNS: 122 (6.8%) Yandex: 12 (0.7%) NextDNS: 8 (0.4%) VeriSign: 3 (0.2%) Neustar: 2 (0.1%) CleanBrowsing: 1 (<0.1%)
		355, <i>n</i> = 2 (25.9%)	
		38, <i>n</i> = 3 (2.8%)	
Public + local	1,636 (15.4%)	825, <i>n</i> = 1 (50.4%)	Google: 1,357 (56.7%) VeriSign: 656 (27.4%) Cloudflare: 263 (11.0%) OpenDNS: 54 (2.3%) Quad9: 47 (2.0%) Yandex: 13 (0.5%) Neustar: 2 (0.1%) NextDNS: 2 (0.1%) OpenNIC: 1 (<0.1%)
		811, <i>n</i> = 2 (49.6%)	

>28% of 10.6k RIPE atlas probes (and their host network) use at least one public DNS service

>9% use one and only one public DNS service

Probes that use public DNS service by default will conduct measurements with **unintended** side-effects

# DNS Centralisation | Path Lengths

- ▶ >18% AS paths to ISP resolvers have lengths > 1.
- ▶ >80% AS paths to Google have lengths 2.
- ▶ >90% AS paths to Cloudflare/Quad9 have lengths 3.

Google often directly peers with the ISP.

Google edge caches deployed inside the ISP **do not** (yet) offer public DNS services.

Paths in South America to all public DNS services are **more inflated** than at other regions

Response Times

## Recap

## References

# DNS Centralisation | Latency

- ▶ 75% of all samples within 40ms latency.
- ▶ Cloudflare and OpenDNS **faster** than ISP resolvers in 50% of the probes.
- ▶ Google public DNS latencies **inflated** in AF.
- ▶ Public DNS resolvers **slower** than ISP resolvers in regions beyond EU and NA.

Users in EU and NA **do not** substantially benefit in latency when switching to a public DNS service.

Latencies offered by public DNS services over **IPv6** remain inflated in AF and SA.

## Measuring DNS over TLS from the Edge: Adoption, Reliability, and Response Times PAM'21

Trinh Viet Doan, Irina Tsareva, Vaibhav Bajpai

### Motivation and Problem Statement

- ▶ The Domain Name System (DNS) is a cornerstone of communication on the Internet.
- ▶ However, DNS over UDP/53 is vulnerable to **eavesdropping and information exposure**.
- ▶ **DNS over TLS/853** (DoT) standardized in 2016 (RFC 7858) to encrypt DNS messages.
- ▶ DoT is supported since Android 9 (2018) and iOS/macOS (2020).
- ▶ However, previous work on DoT largely considers university – proxy – data-center networks.

What is the state of adoption and traffic share of DoT at the edge?

Do home users experience benefit (or suffer) from accessing the Internet using DoT (in terms of reliability and latency) when compared to traditional DNS/53?

## ▶ Adoption

- ▶ <1% amongst 1.2M open DNS resolvers.
- ▶ Albeit, adoption has increased by >23% (2020).
- ▶ TLS 1.3 support (in DoT) has increased to 20%.

## ▶ Reliability

- ▶ DoT failures can be inflated by up to 30% compared to Do53.
- ▶ Possibly due to ossification caused by middle-boxes.

## ▶ Response Times

- ▶ Higher by >100 ms for DoT compared to Do53.
- ▶ Comparable across local / public resolvers.

A first study to provide empirical grounding of using DNS over TLS from the edge of the network.

## Methodology

- >3.2K RIPE Atlas home probes
- >15 public resolvers (5 with DoT) + local resolvers.
- >200 domains queried for A records over IPv4.
- >90M DNS requests/responses overall.

### Recap

### References

- ▶ Step 1: Scan the IPv4 address space for Open DNS resolvers (UDP/53)
- ▶ Step 2: Check DoT support for 1.2M IP endpoints (2019).

	April 2019	January 2020	
DoT Open Resolvers	1,747	2,151	+ 23.1%
Support TLS 1.3	79 (4.5%)	433 (20%)	+ 448%
Support TLS 1.2	1,701 (97%)	2,149 (99.9%)	+ 26.3%
No Support for TLS 1 or 1.1	80 (4.6%)	508 (24%)	+ 535%
Use self-signed cert	11 (0.63%)	355 (17%)	
Use GoDaddy as CA	1,572 (90%)	1,534 (71%)	
Use Let's Encrypt as CA	90 (5.2%)	118 (5%)	

DoT (and subsequently TLS 1.3) adoption has **increased** by >23% (>20%)

Albeit, overall adoption is still **low** (<1%)

# DNS over TLS | Reliability

- ▶ Failures due to timeouts, socket and TCP/TLS errors.
- ▶ DoT failures can be up to >30%
- ▶ Possibly caused by blackholing of DoT packets by middle-boxes.
- ▶ Higher failures in AF and SA.
- ▶ DoT failures higher over local than public resolvers.

DoT exhibits **higher failures** than Do53. Failures are more pronounced over local resolvers.

# DNS over TLS | Response Times

- ▶ Do53: <30 ms for most resolvers (median)
- ▶ DoT: <150 ms for faster resolvers (median)
- ▶ Higher response times in AF and SA.

DoT response times inflated by >100 ms compared to Do53.

DoT response times for local resolvers comparable to that of public resolvers.

## A First Look at DNS over QUIC PAM'22

Mike Kosek, Trinh Viet Doan,  
Malte Granderath, Vaibhav Bajpai

### Motivation and Problem Statement

- ▶ DNS over TLS (standardized in 2016) and DNS over HTTPs (in 2018) leverage TLS/TCP for transport.
- ▶ However, both are **constrained** by limitations of TCP.
- ▶ **QUIC** solves head of line blocking, supports multiplexing, and lowers handshake times.
- ▶ DNS over QUIC (under standardisation) is the natural evolution to improve DNS performance and privacy.
- ▶ However, there exists **no previous work** on **DoQ** yet.

What is the state of adoption of DoQ?

Do DoQ servers and clients leverage the full potential of QUIC to improve privacy and lower response times?

## ► Adoption

- > 1.2k resolvers offer DoQ support.
- > 1.8k unique X.509 certs observed.

## ► Response Times

**Only** 20% of the samples show DoQ interactions utilising full DoQ.

40% samples show **higher** handshake times due to additional round-trips.

A first study to evaluate support of DNS over QUIC in the real world.

## Methodology

Measurements from the TUM research network (blue dot)

> 25 weeks of ZMAP scans towards DoQ/DoUDP ports.

- \* A three step validation phase using:
  - QUIC version negotiation
  - ALPN identifiers and
  - QUIC connection establishment
- \* developed `dnsp perf` to measure DoQ, DoTCP, DoUDP, DoT, DoH response times by querying an **A** record.

# DNS over QUIC | Adoption

- ▶ Number of DoQ verified resolvers (>1.2k) steadily rose by >46% in 29 weeks.
- ▶ Multiple resolvers use [Adguard Home](#) DoQ server implementation (using QUIC v1).

Large fraction of DoQ resolvers observed in Asia (>45%) and Europe (>32%)

AdGuard and nextDNS use DoQ as part of the DNS-based [ad and tracker blocking](#) services

# DNS over QUIC | Response Times

- ▶ We observed **no support** for TCP keepalives, TFO or 0-RTT.
- ▶ DNS request-response time is comparable across all DoX protocols and **resembles the RTT** of the end-to-end connection.
- ▶ **DoTCP** has the fastest handshake. **DoT and DoH** handshake times are slower and comparable (TCP + TLS 1.3)
- ▶ **Only 20%** DoQ samples match DoTCP handshake times.
- ▶ **40%** DoQ samples exhibit **additional 1 RTT** due to some servers enforcing traffic amplification limits on already validated clients.

DoQ offers the **best** choice for DNS privacy. It **outperforms** both DoT and DoH in latency.

## 1. Age of Hyper-giants

- ▶ **An Empirical View on Consolidation of the Web** TOIT '22  
Hyper-giant penetration has nearly **doubled** from 2015–2020, and is **higher** among more popular domains.
- ▶ **Evaluating Public DNS Services in the Wake of Increasing Centralization** NETWORKING '21  
Google edge caches deployed inside the ISP **do not** (yet) offer DNS services. Users in EU/NA **do not** substantially benefit in latency with a public DNS service. Latencies offered by public DNS services over **IPv6** remain inflated in AF and SA.

## 2. Towards Digital Sovereignty: Improving Privacy in DNS

- ▶ **Measuring DNS over TLS from the Edge** PAM '21  
DoT adoption has increased year over year, although overall adoption is still **low** (<1%)  
DoT exhibits **higher failures** than Do53, and are more pronounced over local resolvers.  
DoT response times are inflated by **>100 ms** compared to Do53.  
DoT response times are comparable for local and public resolvers.
- ▶ **A First Look at DNS over QUIC** PAM '22  
First usage of DoQ seen as part of DNS-based **ad and tracker blocking** services  
DoQ offers the **best** choice for DNS privacy, **outperforms** both DoT and DoH in latency.
